1 Course Information

1.1 Catalog Description

An introduction to the organization and operation of the health systems of Canada as well as to various associated concepts including a variety of Electronic Healthcare Record systems, healthcare data and knowledge sharing, evidence- and proximity-based medicine, interoperability between diverse and distributed systems, medical terminology standards and clinical web applications.

1.2 Course Prerequisite(s) and Logistics

Prerequisite(s): Computer Science 3413 (Databases) or equivalent

Lecture: Mon/Wed, 2:30–4:00 PM, RB 3024
Lab: Thursday, 10:30–11:30 AM, AT 3001
Course website: MyCourseLink (D2L)

1.3 Course Instructor

Saikat Mondal, PhD
Office: AT 4006
Office hours: By email/appointment
Email: saikat.mondal@lakeheadu.ca

1.4 Teaching Assistants

Anisha Hiwale
Gabriela Cristina Cardoso de Sousa

1.5 Learning Outcomes

By the end of this course, students are expected to:

1. explain the evolution, scope, and technological context of health informatics, identify major health informatics systems, and describe the relationships among health informatics, health management, and health policy.
2. explain fundamental computing, networking, Internet, storage, database, data warehouse, cloud computing, and Internet of Things (IoT) concepts relevant to health informatics and health information systems.
3. describe the information system life cycle and apply fundamental concepts of system analysis and design, including development methodologies, data modelling, agile approaches, and requirements engineering.
4. explain usability, user-centred design, and user experience principles, identify basic usability problems in software interfaces, and describe the role of usability in information system analysis and design.
5. describe major hospital information systems and their functions, including hospital information systems (HIS), electronic medical records (EMR), computerized provider order entry (CPOE), clinical decision support systems (CDSS), and picture archiving and communication systems (PACS).
6. explain the principles and applications of virtual care, including telemedicine and telehealth, synchronous and asynchronous applications, store-and-forward approaches, and their advantages and challenges.
7. explain consumer health informatics and evaluate common applications, including consumer decision support systems, virtual communities, mobile health (mHealth), wearable and personal health devices, personal health records (PHR), and patient portals.
8. describe the principles and components of public health informatics, including public health surveillance, relevant technologies and institutions, and their applications within the Canadian context.
9. distinguish among electronic medical records (EMR), electronic health records (EHR), and personal health records (PHR), and explain EHR development, functionality, adoption, and key Canadian digital health initiatives.
10. explain the use of analytics, machine learning, and artificial intelligence in healthcare, distinguish major types of analytics and machine learning approaches, and discuss associated ethical challenges.
11. explain fundamental principles of health information privacy, confidentiality, and security, including consent, PIPEDA, data integrity, audit trails, encryption, and digital certificates.
12. discuss emerging trends and challenges in health informatics, including big data, predictive analytics, data mining and visualization, serious gaming, mobile health, wearable technologies, and smart homes.

1.6 Course Overview

This course provides an introduction to the foundations, technologies, systems, applications, and emerging trends of health informatics. It examines how information and computing technologies support healthcare, public health, and health information management, with attention to the Canadian context. The course also addresses human factors, analytics and artificial intelligence, and the privacy and security of health information. The major topics covered include:

❶ **Foundations of Health Informatics.** Evolution and scope of health informatics, major health informatics systems, technological context, and relationships with health management and health policy.

❷ **Computing and Information Systems.** Computing fundamentals, networks and the Internet, databases, data warehouses, storage, cloud computing, Internet of Things (IoT), and health information systems.

❸ **Information System Analysis, Design, and Usability.** Information system life cycle, system development methodologies, data modelling, agile approaches, requirements engineering, usability, user-centred design, and user experience.

❹ **Hospital Information Systems.** Major information systems used in hospitals, including HIS, RIS, LIS, PIS, EMR, CPOE, CDSS, and PACS, together with their basic functions, advantages, and challenges.

❺ **Virtual Care and Consumer Health Informatics.** Telemedicine and telehealth, synchronous and asynchronous applications, consumer health informatics, mobile health, wearable and personal health devices, personal health records, and patient portals.

❻ **Public Health Informatics and Electronic Health Records.** Public health surveillance and informatics technologies, electronic health records, Canada's Health Infostructure, EHR functionalities, and Canadian digital health initiatives.

❼ **Health Analytics, Machine Learning, and AI.** Healthcare analytics, descriptive, diagnostic, predictive, and prescriptive analytics, supervised and unsupervised learning, and ethical challenges associated with machine learning and artificial intelligence.

❽ **Privacy and Security of Health Information.** Privacy, confidentiality, consent, data and system security, PIPEDA, audit trails, data integrity, encryption, and digital certificates.

❾ **Emerging Trends in Health Informatics.** Big data, predictive analytics, data mining and visualization, serious gaming, mobile health, wearable technologies, and smart homes.

2 Course Topics and Details

Week	Date	Topic	Reading / Reference	Milestones
W1	2026-09-09	**Introduction to Health Informatics:** Evolution of health informatics, health informatics systems, intersections with health management and policy, technological context, and competencies of health informatics professionals.	El Morr, Ch. 1	—
W2	2026-09-14 2026-09-16	**Computers, Networks, and Databases:** Computing fundamentals, computer components, networks and the Internet, wireless technologies, IoT, storage and backup, data and information, databases, data warehouses, big data analytics, cloud computing, and health information systems.	El Morr, Ch. 2	P0
W3	2026-09-21 2026-09-23	**Information System Analysis and Design:** Information system life cycle, system design and development methodologies, data modeling, CASE tools, agile methodology, and requirements engineering.	El Morr, Ch. 3	P1
W4	2026-09-28 2026-09-30	**The Human Factor: Usability and User Experience:** Usability and user-centred design, usability and user experience goals, software interface usability, and the role of usability in system analysis and design.	El Morr, Ch. 4	A1
W5	2026-10-05 2026-10-07	**Information Systems in Hospitals:** Hospital information systems, RIS, LIS, PIS, electronic medical records, computerized provider order entry, clinical decision support systems, and picture archiving and communication systems.	El Morr, Ch. 5	P2
—	—	**Fall Reading Week**	—	—
W6	2026-10-19 2026-10-21	**Virtual Care:** Telemedicine and telehealth, synchronous and asynchronous applications, store-and-forward applications, advantages and challenges of telemedicine, telemedicine in Canada, and disruptive telemedicine technologies.	El Morr, Ch. 6	MT1
W7	2026-10-26 2026-10-28	**Consumer Health Informatics:** Consumer health informatics applications, consumer decision support systems, virtual communities, mobile health, wearable and personal health devices, body area networks, personal health records, and patient portals.	El Morr, Ch. 7	P3, A2
W8	2026-11-02 2026-11-04	**Public Health Informatics:** Public health principles and components, public health surveillance, technologies for public health informatics, Canadian public health informatics institutions, and the Global Public Health Intelligence Network.	El Morr, Ch. 8	—

Week	Date	Topic	Reading / Reference	Milestones
W9	2026-11-09 2026-11-11	**Electronic Health Records:** EMR, EHR, and PHR; challenges of building EHRs; Canada's Health Infostructure; EHR and Digital Health Blueprints; EHR functionalities and projects; and EMR adoption and maturity.	El Morr, Ch. 9	P4
W10	2026-11-16 2026-11-18	**Healthcare Analytics:** Healthcare analytics and their applications; descriptive, diagnostic, predictive, and prescriptive analytics.	El Morr, Ch. 10	MT2
W11	2026-11-23 2026-11-25	**Machine Learning and AI for Health:** Supervised and unsupervised learning and their applications; ethical challenges associated with machine learning and AI.	El Morr, Ch. 10; selected research literature	A3
W12	2026-11-30 2026-12-02	**Privacy, Confidentiality, and Security:** Privacy and confidentiality, data and system security, explicit and implied consent, PIPEDA, audit trails, data integrity, symmetric and asymmetric encryption, and digital certificates.	El Morr, Ch. 11; selected research literature	P5, P6
W13	2026-12-07	**Emerging Trends in Health Informatics:** Big data and information management, modelling, predictive analytics, data mining and visualization, serious gaming, mHealth, wearable devices, and smart homes.	El Morr, Ch. 12; selected research literature	P6

Note: The instructor may adjust selected weekly topics, as appropriate, and may replace certain topics with relevant guest lectures (**P** = Project Milestones; **MT** = Mid-Term; **A** = Assignment).

3 Recommended Readings/Textbooks

The required textbook for this course is:

- Christo El Morr, **Introduction to Health Informatics** , 2nd Edition, Canadian Scholars, 2023.

The textbook provides the foundational material for the course and will be complemented by contemporary research and applied resources in health informatics. The tentative class schedule identifies the relevant textbook chapters for each topic, where appropriate.

Additional Recommended Textbooks

[1] William Hersh, ed., **Health Informatics: Practical Guide**, 8th Edition, 2022.

[2] Edward H. Shortliffe and James J. Cimino, eds., **Biomedical Informatics: Computer Applications in Health Care and Biomedicine**, 5th Edition, Springer, 2021.

Additional Resources

[1] Selected research articles, technical reports, and instructor-provided materials related to health informatics and emerging developments in the field will be made available through MyCourseLink.

[2] Recommended readings for individual topics and lectures will be posted on MyCourseLink throughout the term.

Students are expected to use the required textbook and assigned supplementary materials to support their learning and to prepare for lectures, assessments, and other course activities.

4 Assessment and Grading

The course assessments are designed to evaluate students' understanding of health informatics concepts and their ability to apply these concepts to practical problems. Assessment will be based on individual assignments, two midterm examinations, and a group health informatics project.

4.1 Evaluation Components

The course workload consists of the following components:

- **Assignments (15%):** Three individual assignments, worth 5% each, will assess selected concepts and applications covered throughout the course.
- **Midterm Examinations (40%):** Two individual midterm examinations will assess students' understanding and application of material from the required textbook, lectures, and assigned supplementary materials. Midterm 1 is worth 15% and Midterm 2 is worth 25%.
- **Group Health Informatics Project (45%):** Students will work in groups of approximately four to five students to complete a term project addressing an instructor-approved problem or application in health informatics. The project will progress through a series of milestones involving problem definition, requirements and design, prototyping, final development and evaluation, and presentation.

4.2 Grading Scheme

Table 2: Grading Scheme

Assessment	**Tentative Timing**	**Weight**
Assignment 1	Around Week 4	5%
Assignment 2	Around Week 7	5%
Assignment 3	Around Week 10	5%
Midterm 1	Around Week 6	15%
Midterm 2	Around Week 11	25%
Group Health Informatics Project	Throughout the term	45%
Total		**100%**

4.2.1 Assignments

Three individual assignments will be conducted throughout the term. The assignments will assess selected health informatics concepts and their application to relevant problems and scenarios. Each assignment is worth 5% of the final grade.

Detailed requirements, submission instructions, and due dates for each assignment will be provided during the term.

4.2.2 Midterm Examinations

Two individual midterm examinations will be conducted during the term:

- **Midterm 1: 15%**
- **Midterm 2: 25%**

Both midterms will be conducted **in person during the regularly scheduled class time** and will use a mixed-question format. Questions may be based on material from the required textbook, lectures, and assigned supplementary materials.

Midterm 2 will be cumulative, with greater emphasis on material covered after Midterm 1.

4.2.3 Group Health Informatics Project

Students will work in groups of approximately four students to complete a term project addressing an instructor-approved problem or application in health informatics.

The instructor will provide suitable project options. Teams may also propose their own health informatics project topic, subject to instructor approval. Depending on the selected topic, students will design, prototype, and, where appropriate, implement a software-based solution addressing an aspect of health informatics. Projects must be appropriately scoped for completion within one academic term.

The project will progress through a series of milestones so that teams can demonstrate progress and receive feedback throughout the term.

Problem $\rightarrow$ **Requirements** $\rightarrow$ **Design** $\rightarrow$ **Prototype** $\rightarrow$ **Final Solution** $\rightarrow$ **Presentation**

Project Milestones

The project follows a staged development process. In particular, teams are expected to investigate relevant literature and existing systems before finalizing their proposed solution. The goal is to ensure that the project is informed by existing work and includes a meaningful improvement, novel feature, or well-justified adaptation rather than simply reproducing an existing application.

P0 – Team Formation and Topic Selection: Students will form teams of approximately four members. Each team will select an instructor-provided project theme or propose its own health informatics project for instructor approval. Each team will also create a shared repository (e.g., GitHub) for project development, collaboration, and version control. At this stage, the topic may be preliminary and can be refined based on the team's subsequent investigation of relevant literature and existing systems.

P1 – Project Proposal: Teams will define the health informatics problem they intend to address, explain its motivation, identify the intended users or stakeholders, establish preliminary objectives and scope, and describe their initial idea for a potential solution.

The proposal should clearly explain **why the selected problem is meaningful in a health informatics context**. The proposed solution at this stage is preliminary and may be refined after completing the literature and existing-system analysis.

P2 – Literature and Existing-System Analysis: Before finalizing the proposed solution, each team will investigate relevant **research literature and existing applications, systems, or technological**

Table 3: Group Health Informatics Project Milestones

Milestone	Primary Deliverables	Weight
P0: Team Formation and Topic Selection	Team formation, preliminary project topic, repository setup (e.g., GitHub), and instructor approval.	Mandatory
P1: Project Proposal	Problem description, motivation, objectives, intended users, preliminary proposed solution/methodology, and project scope.	5%
P2: Literature and Existing-System Analysis	Review of relevant literature and existing applications/systems, comparative analysis, identified gaps or limitations, and proposed novel contribution or feature.	7%
P3: Requirements and Design	Refined solution/methodology, major requirements, system functionality, design or architecture, technology selection, and project plan.	7%
P4: Prototype and Progress Evaluation	Working prototype demonstrating meaningful functionality, progress documentation, and identification of remaining work and challenges.	8%
P5: Final Project and Report	Final project deliverables, completed solution or prototype, testing/evaluation where appropriate, documentation, and final written report.	13%
P6: Final Presentation and Demonstration	Presentation of the problem, existing work and identified gap, proposed solution, major design decisions, project outcomes, and demonstration of the final system or prototype.	5%
Total		**45%**

solutions related to its project.

Teams will:

- identify and review relevant research literature;
- investigate representative existing systems, applications, or solutions;
- compare their major features, approaches, strengths, and limitations;
- identify a meaningful gap, limitation, unmet user need, or opportunity for improvement; and
- define the team's proposed **novel contribution, feature, integration, or improvement** based on this analysis.

The objective is not to require research-level novelty. Rather, teams should demonstrate that they understand what already exists and can justify how their project provides meaningful additional value.

For AI/ML/Generative AI projects, simply integrating an existing AI model or API will not, by itself, be considered a sufficient contribution. Teams should identify a meaningful application, feature, workflow, evaluation approach, or improvement that distinguishes their project from a basic implementation of an existing tool.

P3 – Requirements and Design: Based on the findings from P1 and P2, teams will refine their proposed solution and identify its major functional and non-functional requirements.

Teams will develop an appropriate system design or architecture, identify the major system components and interactions, select appropriate technologies, and establish a project plan for the remaining development activities.

The requirements and design should clearly reflect the **gap or opportunity identified in the literature and existing-system analysis**.

P4 – Prototype and Progress Evaluation: Teams will demonstrate a working prototype that provides evidence of meaningful progress toward the proposed solution.

The prototype should demonstrate important functionality rather than only interface mock-ups or static screens. Where AI/ML/Generative AI is a major component, the prototype should demonstrate meaningful integration of that component into the overall application or workflow.

The submission will also document completed work, remaining tasks, significant technical challenges, and any necessary changes to the original requirements or design.

P5 – Final Project and Report:

Teams will submit their final project deliverables together with a written report.

Depending on the nature of the project, the final deliverables may include a working software system or prototype, trained or integrated AI/ML components, mobile or web applications, relevant datasets, testing or evaluation results, technical documentation, and other artifacts specified by the instructor.

The final report will include:

- problem and motivation;
- relevant literature and existing systems;
- identified gap, limitation, or opportunity;
- proposed contribution or novel feature;
- requirements and system design;
- implementation or prototyping process;
- testing and evaluation;
- project outcomes;
- limitations and opportunities for future improvement; and
- relevant health informatics considerations.

For projects involving AI/ML/Generative AI, teams should provide an appropriate evaluation of the AI-enabled component rather than relying only on a demonstration that the component produces output. The evaluation method should be appropriate to the scope and nature of the project.

P6 – Final Presentation and Demonstration: Each team will present its project and demonstrate the final system or prototype.

The presentation will summarize the:

- health informatics problem and motivation;

- most relevant existing approaches or systems;
- gap or opportunity identified by the team;
- proposed contribution or novel feature;
- major design and implementation decisions;
- final system or prototype;
- evaluation and major findings;
- limitations; and
- lessons learned.

The demonstration should show the major functionality of the developed system, including the team's proposed contribution or distinguishing feature.

Questions may be directed to individual team members to assess their understanding of the project, technical decisions, and contribution to the work.

4.2.4 Assessment-at-a-Glance

The overall assessment structure can be summarized as:

Assignments (15%) + **Midterms (40%)** + **Group Project (45%)** = **100%**

The assessment structure can therefore be summarized as:

Learn and Apply → **Analyze** → **Design** → **Prototype** → **Evaluate** → **Present**

Final Exam: There is no final examination in this course.

5 Course Policies

5.1 Submission of Course Work

Assignments and project deliverables must be submitted through the appropriate submission area on MyCourseLink (D2L), unless otherwise specified by the instructor. Submission requirements, due dates, and any additional instructions will be provided with each assessment.

Students are responsible for ensuring that the correct and complete files are submitted before the stated deadline. Students should verify their submissions after uploading them to MyCourseLink.

5.2 Late and Missed Submissions

Students are expected to submit assignments and project milestones by the posted deadlines. Late-submission rules and any applicable penalties will be specified with the corresponding assessment.

Extensions may be granted by the instructor when appropriate. Students who anticipate being unable to meet a deadline because of medical, compassionate, accessibility, or other significant circumstances should contact the instructor as early as reasonably possible.

Approved academic accommodations will be respected in accordance with Lakehead University policies and Student Accessibility Services (SAS) procedures.

Failure to submit required course work without an approved extension or accommodation may result in a grade of zero for the missed assessment.

5.3 Midterm Examinations

Students are expected to complete both midterm examinations at the scheduled times. Unless explicitly permitted by the instructor, students must complete examinations independently and must not access unauthorized people, materials, resources, or tools.

Students who are unable to complete a midterm because of illness or other significant circumstances should notify the instructor as soon as reasonably possible and follow applicable Lakehead University procedures. Any alternative assessment or arrangement will be determined in accordance with University requirements and the circumstances involved.

5.4 Attendance and Participation

Regular attendance and active participation are strongly recommended. Lectures may include explanations, examples, discussions, demonstrations, and other material that supplements the required textbook and posted course materials.

Students are responsible for keeping up with course announcements, materials, assessment requirements, and schedule changes regardless of attendance.

5.5 Course Communication

MyCourseLink (D2L) and Lakehead University email will be the primary channels for course communication. Course announcements, assessment information, learning materials, and schedule updates may be posted through MyCourseLink and/or communicated through University email.

Students are responsible for checking MyCourseLink and their Lakehead University email regularly. Students may contact the instructor using their Lakehead University email account.

5.6 Course Schedule and Changes

The course schedule is tentative and may be adjusted to reflect the pace and needs of the class, availability of guest speakers, or other academic considerations. Any significant changes to course activities, assessment dates, or requirements will be communicated to students through MyCourseLink and/or Lakehead University email.

5.7 Use of Generative AI

The use of generative artificial intelligence (GenAI) tools, including tools that generate or substantially modify text, code, images, or other content, is **permitted only when explicitly authorized by the instructor for a particular assessment or activity**.

Permission to use GenAI for one assessment does not imply permission to use it for other assessments. Assignment and project instructions will specify whether GenAI tools are permitted and, where applicable, the conditions governing their use.

When GenAI use is permitted, students remain responsible for the accuracy, quality, originality, and integrity of all submitted work. Students must critically evaluate AI-generated content and follow any disclosure, acknowledgement, citation, or documentation requirements specified by the instructor.

Unless explicitly permitted, GenAI tools must not be used during midterm examinations or other assessments designated for independent completion.

Using AI tools without permission, outside the conditions established by the instructor, or in a manner that misrepresents authorship may constitute academic misconduct under Lakehead University's Student Code of Conduct – Academic Integrity.

Students who are uncertain whether a particular use of AI is permitted must ask the instructor **before** using the tool.

For Lakehead University's guidance on the use of ChatGPT and other AI tools, see: ChatGPT & Other AI Tools – Lakehead University.

5.8 Academic Integrity

Academic integrity is a fundamental expectation of this course and of Lakehead University. Students are responsible for completing their own original work, appropriately documenting and acknowledging sources, collaborating only when authorized, and avoiding misrepresentation.

Unless otherwise stated by the instructor:

- individual assignments must be completed independently;
- collaboration on group project work is permitted only within the assigned project team;
- students must appropriately acknowledge external sources and contributions;
- unauthorized assistance, including unauthorized use of generative AI tools, is not permitted; and
- examinations must be completed independently using only the materials and resources explicitly permitted by the instructor.

Plagiarism, cheating, unauthorized collaboration, falsification, use of unauthorized materials, and other forms of academic misconduct will be addressed in accordance with Lakehead University's *Student Code of Conduct – Academic Integrity*.

Students are responsible for familiarizing themselves with the University's Academic Integrity requirements:

Lakehead University – Student Conduct and Academic Integrity

5.9 Group Project Responsibilities

The health informatics project is collaborative work. Each team member is expected to participate meaningfully and responsibly in the project and to understand the major components and

decisions associated with the team's work.

Teams should distribute responsibilities appropriately while maintaining regular communication and collaboration. Project work submitted by a team represents the work of the team as a whole.

The instructor may ask questions of individual team members during project meetings, presentations, or demonstrations to assess individual understanding and contribution. Significant concerns regarding participation or contribution may be considered when assessing individual performance.

5.10 Recording of Lectures and Course Activities

Students may not record, reproduce, distribute, post, or otherwise share lectures or course activities without permission from the instructor, except where recording is authorized as part of an approved academic accommodation.

Students with an approved recording accommodation through Student Accessibility Services must follow the applicable accommodation requirements and confidentiality agreement. Authorized recordings are for the student's private educational use and must not be distributed or shared without appropriate permission.

5.11 Copyright and Course Materials

Course materials provided by the instructor, including lecture slides, notes, assignment and project materials, assessment materials, recordings, and materials posted to MyCourseLink, are provided for students' personal educational use in this course.

Students must not reproduce, upload, distribute, sell, publish, or otherwise share course materials outside the course without appropriate authorization. Students are expected to respect applicable copyright law, intellectual property rights, and University policies.

5.12 Student Accessibility Services

Lakehead University is committed to providing equitable access to academic activities for students with disabilities and/or medical conditions. Student Accessibility Services (SAS) coordinates and facilitates academic accommodations for students with temporary and permanent disabilities and medical conditions.

Students who require or believe they may require academic accommodations are encouraged to contact SAS and begin the accommodation process as early as possible. Students with approved accommodations are responsible for following the applicable SAS procedures, including procedures and deadlines for accommodated tests and examinations.

Information about Student Accessibility Services is available at:

Lakehead University – Student Accessibility Services

5.13 Student Support Resources

Lakehead University provides a range of academic, accessibility, health, wellness, and student-support services. Students are encouraged to seek assistance when needed. Key resources

include:

- **Student Success Centre:** Academic skills, writing support, academic success coaching, peer mentorship, and other learning supports.

  Lakehead University – Student Success Centre

- **Student Accessibility Services (SAS):** Academic accommodations and accessibility support for students with disabilities and/or medical conditions.

  Lakehead University – Student Accessibility Services

- **Student Health and Wellness:** Health, wellness, and mental-health-related services and resources.

  Lakehead University – Student Health and Wellness

- **Lakehead University Library:** Research resources, databases, learning materials, and research assistance.

  Lakehead University Library

5.14 University Regulations

Students are responsible for familiarizing themselves with and complying with the applicable regulations, policies, procedures, and academic requirements of Lakehead University.

University regulations and academic requirements are available through the Lakehead University Academic Calendar and University policy resources. Where this course outline and an official University policy or regulation conflict, the applicable University policy or regulation takes precedence.

6 Land Acknowledgment

Lakehead University respectfully acknowledges its campuses are located on the traditional lands of Indigenous Peoples. Lakehead Thunder Bay is located on the traditional lands of the Fort William First Nation, Signatory to the Robinson Superior Treaty of 1850. Lakehead Orillia is located on the traditional territory of the Anishinaabeg. The Anishinaabeg include the Ojibwe, Odawa, and Pottawatomi nations, collectively known as the Three Fires Confederacy. Lakehead University acknowledges the history that many nations hold in the areas around our campuses, and is committed to a relationship with First Nations, Métis, and Inuit Peoples based on the principles of mutual trust, respect, reciprocity, and collaboration in the spirit of reconciliation.
